

MAT 285 Differential Equations

COURSE DESCRIPTION:

Prerequisite(s): MAT 272

Corequisite(s): None

This course provides an introduction to topics involving ordinary differential equations. Emphasis is placed on the development of abstract concepts and applications for first-order and linear higher-order differential equations, systems of differential equations, numerical methods, series solutions, eigenvalues and eigenvectors, and LaPlace transforms. Upon completion, students will be able to demonstrate understanding of the theoretical concepts and select and use appropriate models and techniques for finding solutions to differential equations-related problems with and without technology. *This course has been approved for transfer under the CAA as a premajor and/or elective course requirement.*

Course Hours Per Week: Class, 2. Lab, 2. Semester Hours Credit, 3.

LEARNING OUTCOMES:

Upon completing requirements for this course, the student will be able to:

1. Find general solutions to first-order, second-order, and higher-order homogeneous and non-homogeneous differential equations by manual and technology-based methods
- 2.

- E. Nonhomogeneous equations—undetermined coefficients
 - F. Forced oscillations and resonance
 - G. Nonhomogeneous equations—variation of parameters
 - H. Series solutions
- III. Linear Systems of Differential Equations
- A. The method of elimination
 - B. The eigenvalue method for homogeneous systems
 - C. Phase portraits for two-dimensional systems
 - D. Applications
- IV. Laplace Transform Methods
- A. Laplace transforms and inverse transforms
 - B. Initial-value problems
 - C. Translation and partial fractions
 - D. Impulses and delta functions

REQUIRED TEXTBOOK AND MATERIAL:

The textbook and other instructional material will be determined by the chair/instructor.
